

# **H.D. SETTLEMENT REPORT BAGALKOT TALUKA**

**1883**

सत्यमेव जयते

No. 3467 of 1883.

FROM

ARTHUR CRAWFORD, ESQUIRE,  
Commissioner, S. D. ;

TO

JOHN NUGENT, ESQUIRE,  
SECRETARY TO GOVERNMENT, BOMBAY,  
Revenue Department.

Poona, 10th December 1883.

SIR,

Revision Settlement, Bágalkot Táluka. I have the honour to submit for the consideration and orders of Government communications noted in the margin containing proposals for the revision of the Survey Commissioner's letter No. 2530, existing rates of assessment in 126 villages dated 26th November 1883. of the Bágalkot Táluka of the Kaládgi Letter from the Collector of Kaládgi, No. 3880, dated 7th September 1880. Collectorate. Letter from the Superintendent, Revenue Survey, No. 680, dated 30th June 1883.

2. One hundred and twenty-four of these villages forming the old Bágalkot Táluka were first settled in 1850-51 under the superintendence of Sir George Wingate. The remaining 2, which were settled subsequently, also fall in for revision concurrently with the adjoining villages.

3. The 126 villages comprise 322,086 acres or 503 square miles and they contain a population of 67,264\* or an average of 134 to the mile. In 1850-51 the population amounted to 61,540 or 9 per cent. less than the present population.

4. It is satisfactory to notice that the system of partial remeasurement was applied to the full extent to the villages under report. It appears from para. 2 of the Superintendent's letter that 98 villages were only partially surveyed and out of the 13,577 old survey numbers no less than 8,281 or 60 per cent. were confirmed without remeasurement; in the remaining 28 small villages owing to the vast preponderance of survey numbers requiring to be remeasured under the Rules, a complete resurvey was found to be more economical. The general result of the remeasurement appears to be as under :—

		Arable.	Unarable.	Total.
		Acres.	Acres.	Acres.
Former Survey	...	250,738	70,688	321,426
Present do.	...	253,260	68,826	322,086
	Increase	2,522	.....	660
	Decrease	.....	1,862	.....

It will be seen that the difference between the two surveys was insignificant, being only .2 per cent. The increase in the arable area appears to be due to a corresponding reduction from what was considered as unarable at the first settlement. It is not shown how much of this was due to 'Pot-kharab' being now rated as arable, but the area cannot be large. Where there is reason to believe, as in the present case, (*vide* Survey Commissioner's para. 3) that 'Pot-kharab' has been deducted from the area of a field after careful examination, I

\* N.B.—This is according to the Census of 1881. For results of special census which are still more favourable, see post para. 7. and para. 10 of Survey Commissioner's letter,

very much doubt the expediency of disturbing the old arrangement especially as under the system of partial remeasurement and classification only a small percentage of fields come under the scrutiny of the survey officers. It is therefore hard upon the occupant, whose field actually happens to be resurveyed that he should be deprived of the little 'Pot-kharab' that he enjoyed from the first settlement when his neighbour, who has probably utilized his piece also in the same way, escapes assessment because his field is not resurveyed.

5. The reclassification was also carried out partially, 14 per cent. of the total area being alone reclassified. It is indeed a matter of regret that the revaluation of the soil should in any shape be necessary at our revision settlements, but in the present case it was inevitable, because the old classification was originally admittedly, though unavoidably, somewhat faulty. To confirm the old classification, therefore, would have been to perpetuate an inequality of a burden of taxation, which was heavier on comparatively poorer soils. But now that "the present review of the old work has been carried out with the area of possible cultivation approaching its extreme limit and there has consequently been a full opportunity for a calm and dispassionate judgment being formed as to the proper relation in value of the different kinds of soils," I am strongly of opinion that nothing would conduce more to the popularity of the settlement than a declaration from authoritative quarters that no reclassification shall take place in future in the villages in question and that the modifications of rates at future revisions would be entirely dependent on general considerations as stated in section 106 of the Land Revenue Code.

6. Bágalkot which is the Central Táluka of the Kaládgi District contains soils varying from the rich black Regur of the Ghátprabha valley to the light stony soil of the central stony plains. The sub-division is fairly watered—the river Krishna, which forms the northern boundary supplies water to nearly 50 of the villages now being revised and the Ghátprabha which intersects the district also affords a perennial supply of drinking water to men and cattle over an equally extensive tract. The rainfall is somewhat uncertain and partial failures may be expected, but on the whole the average supply (25 inches) is sufficient for all crops usually grown in the District. Much has been done since the last settlement in providing the District with increased facilities of communication both with the coast and the internal marts of trade. The Eastern Deccan Railway, which passes through the táluka and which will be opened in a few months, will also immensely develop the export trade of the District. There are three markets in the táluka—of these Bágalkot is the most important and has an urban population of 12,000. Considerable sales also take place at the weekly markets of Kaládgi and Bilgi, but the course of the whole trade will probably be changed now with reference to the new line of Railway and the District Local Funds Committee are planning new roads as feeders to the Railway line.

7. The statistics and figures given by the Survey and Settlement Commissioner in paras. 10 to 19 of his letter show clearly that notwithstanding the great check received from the late famine, there has been great progress since the date of the original settlement in the material prosperity of the people of the District. Population has increased 27 per cent. Land in occupation held directly from Government has risen by 75,129 acres and the revenue by over 23,000 rupees. It is true some of the occupied land is being thrown up and the area of assessed waste has increased within the last five years but the land, which has gone out of cultivation, is reported to be of inferior description. This, however, suggests the necessity of moderation in future settlements. It is to be regretted Mr. Fletcher should have marred the value of his inferences deducible from statistics by quoting the figures obtained by the classing establishments. The Survey Commissioner properly sets them aside as less reliable than the results of the special census. The statement embodied in para. 10 of Mr. Stewart's letter shows that there has been a marked increase in agricultural stock of every description, except in cows and buffaloes, which have decreased principally on account of the contraction of the grazing areas in recent years. The decrease in horses and ponies is not material as Bágalkot is not a horse-breeding country. The instances of sales, mortgages and leases, which have been collected in Appendices K, L and M of the Superintendent's report show indisputably that the land has everywhere attained a considerable marketable

value. The apparently unfavourable fact of 32 per cent. of the lands being actually cultivated by other than registered occupants, has been very satisfactorily explained by the Survey Commissioner in paras. 13 and 14. It is certain that whatever may be the economical cause of this gradual change of proprietorship, it is not due to the indebtedness of the peasantry.

8. The all-important subject of prices has been discussed by Mr. Stewart in paragraph 19, Mr. Fletcher has shown by a comparison of prices of the last 30 years that the value of the staple products has more than doubled since the date of the original settlement. Mr. McCallum, the Assistant Collector in charge, has arrived at the conclusion that the prices of cereals have risen only about 50 per cent., but Mr. Stewart by comparing the prices now current with those prevailing in the first decade claims an increase of 66 per cent. Taking into consideration the very great fluctuations in prices in recent years, I am not inclined to assume that the prices likely to rule in the next 30 years will be much higher than 50 per cent. of those ruling at the settlement, which has just expired. The average price of jowári, the staple food of the people during 1882-83, was 35 seers, which is very little more than 50 per cent. above the average of the first decade. Mr. Stewart arrives at a more favourable result by taking the average of the 6 months from April to September. This is hardly a fair basis for comparison, because the prices of cereals are always higher in the monsoon months than at other times of the year and the average of the year should include the harvest months, when prices generally are at their lowest; but accepting even the worst forecast of the prices likely to prevail in the future, there can be no doubt that a reasonable enhancement of the assessment may, with propriety, be imposed and can, in my opinion, be borne by the people without hardship. The smoothness with which the revenue is now collected is an indication of the lightness of the present burden. The development of the wheat and cotton export trade on the opening of the railway will certainly bring much more bullion into the country than hitherto and the extra assessment will not press heavily on the ryots.

9. Paragraphs 20 and 21 of the Survey Commissioner's letter contain proposals for deviding the villages into groups and fixing the maximum rate for each description of land. As the groups are formed principally on the same lines as those adopted by Sir George Wingate at the first settlement they generally commend themselves to me with only one exception to be presently mentioned. The maximum rates proposed for groups II. to V. have also my cordial approval as they are characterised by extreme moderation; in no single instance has the enhancement been more than 53 per cent. in case of villages and 33 per cent. for any single group.

10. The town of Bágalkot was, in the original settlement, classed with villages in group No. II. The Survey Commissioner has now singled it out for a higher maximum rate of assessment, viz., Ro. 1-10 on account of the superior advantages it possesses. I, however, differ from the Survey Commissioner and think there are not sufficiently strong grounds for raising the maximum rate in the case of this one town. A reference to the map will show that some of the lands of the surrounding villages, which are grouped in the second class, are as favourably situated, if not better, as regards proximity to the town, as the town lands. In fact within a radius of 5 miles of the town, the advantages from an agricultural point of view may be said to be nearly equal. Turning to the past records I find that Colonel Anderson also did not propose a special extra maximum rate for market towns such as Dhárwár, Hubli, Gadag and Navalgund. Last year no special rate was proposed for Gokák. "The case of the lands near these places is best met by the ordinary extra rate imposable on lands within a certain distance of very large places." The grouping of Bágalkot with the villages in Class II. will not cause much sacrifice of revenue and I would strongly recommend such a course and thus preserve uniformity in regard to all townlands coming under revision.

11. The rates proposed for rice and garden lands have my entire concurrence.

12. The general result of the imposition of the new rates will be an immediate increase to the Government revenue of Rs. 22,282 or 27.9 per cent. as

calculated by the Survey Commissioner. If the recommendation made by me in the last paragraph were sanctioned by Government, the increase will be somewhat less. The assessment of the arable waste (14,567 acres) will be Rs. 5,018, which will be the limit up to which the land revenue will rise, if the whole arable land were taken up for cultivation. The average rate per acre for all kinds and description of land will be Re. 0-11-5 as against Re. 0-9-1 of the first settlement

13. In the concluding paragraph of his letter Mr. Stewart, for what seems to me very cogent reasons, proposes that the revised rates should fully be introduced from 1887-88 and that for the three intermediate years the burden of extra taxation may be reduced by granting remissions at the rate of  $1\frac{1}{4}$  annas in every rupee of the revised assessments. It is not that the district will not bear the whole of the extra burden at once but if the concession recommended by the Survey Commissioner were granted, it would greatly assist the cultivators in replacing agricultural stock, &c.

14. I do not think it necessary to allude to the criticisms of the Collector and his Assistant as they have been fully met by Mr. Stewart.

15. In conclusion I beg that Government may be pleased to pass early orders on these proposals as the Survey Commissioner wishes, if possible, to introduce the new rates this year simultaneously with the Hungund rates, so that the concession will end at the same time in both talukas and the full rates will be levied concurrently.

I have the honour to be,

Sir,

Your most obedient Servant,

ARTHUR CRAWFORD,  
Commissioner, S. D.

No. 2530 OF 1883.

From

T. H. STEWART, ESQUIRE,  
Survey and Settlement Commissioner;

To

THE SECRETARY TO GOVERNMENT,  
Revenue Department.

*Survey Commissioner's Office,  
Bombay, 26th November 1883.*

SIR,

I have the honour to forward a report from the Superintendent of Survey and Assessment, Southern Marátha Country, No. 680, dated 30th June 1883, in which he makes detailed proposals for the revision of the existing rates of assessment in 126 villages of the Bágalkot Táluka of the Kaládgi Collectorate. The original Survey Settlement of 124 of these villages was sanctioned by Government Resolution No. 6287, dated 27th September 1852. The rates for the remaining two villages were sanctioned subsequently, but were arranged to expire concurrently with the expiration of the rates of the bulk of the villages of the táluka.

2. Accompanying Mr. Fletcher's report will be found a paper of remarks by Mr. McCallum, the First Assistant Collector of the district, upon which the Collector Mr. Muir has written some forcible marginal notes. Mr. McCallum's paper may be taken to show the sum-total of the adverse comments which a local officer can find to advance against the scheme of resettlement, and to that extent it is valuable. Seeing that much of the destruction caused by the famine is admitted, the list of objections is by no means formidable. Mr. Muir's forwarding report, however, contains some general criticisms to which I will take an opportunity to reply when considering the question of the proposed enhancement of rates.

3. It will be observed from Mr. Fletcher's report that no general resurvey of these villages has been entered upon. The system of partial remeasurement has been followed, under which only those Survey numbers which have to be broken up in conformity with the rules, those which have had their boundaries altered by natural or artificial causes and those situated in certain positions rendering them liable to alterations are permitted to be remeasured. In 28 small villages, however, owing to the vast preponderance of Survey numbers requiring to be remeasured under these rules, the resurvey has been general in its nature. The result shows numerous discrepancies in the areas of fields of sufficient importance in themselves to justify a partial review of the old work. No less than 262 Survey numbers were discovered with over 15 per cent. of error caused by alluvion and diluvion only. Although, however, there is a large percentage of error in the measurements of individual fields, the difference in the entire area as laid down by the old and present operations is very trifling, being .2 per cent., and the fact that the area of arable dry-crop land as now ascertained is but 2,319 acres in excess of that determined by the original Survey is indicative of a more careful examination of the lands with respect to the area of "Pot khrab" and confirms me in the opinion that in this particular of classification the standard of the Southern Marátha Country Survey of the period we are reviewing was considerably in advance of the Surveys which were being concurrently carried on in the districts of the Deccan.

4. It will be equally gratifying to Government to know that the reclassification in the field of the soils of these villages has extended to only 18 per cent. of Survey numbers and 14 per cent. of acres. There has been therefore as little as possible of that personal harassment of the rayat which has been laid at the door

of our revision operations. It is of course a matter of regret that the revaluation of the soil in any shape should be necessary, but from a close examination of the returns of the reclassified numbers I am of opinion that a continuance of present conditions would give cause for still greater regret in the future. The reclassification, which has been little more than a complete test of the old work, has clearly shown that there is the same narrowing of the distinction between the better and the poorer soils which has been found in all valuations made at the same period, and for which I have attempted to give an explanation in my report on the revision settlement of the Hungund Táluka. When it is considered that at the date of the first settlement more than half the present occupied area was lying waste, including much of the finest land, the temptation of the classing officers to put a valuation on the land which would produce a reversal of these conditions even at some sacrifice of strict relative value may easily be imagined. The present review of the old work has been carried out with the area of possible cultivation approaching its extreme limit and there has consequently been a full opportunity for a calm and dispassionate judgment being formed as to the proper relation in value of the different kinds of soils, without which the general burden of assessment would be so unequally distributed as to cause increased pressure and discontent at each successive enhancement of the maximum rates.

5. The Táluka of Bágalkot contains soils of very varying quality and productiveness from excellent black soil producing cotton and wheat down to the poorest sandy and stony soils which could reasonably be expected to pay a rent in the proper sense of the term. The localities where these soils prevail are fortunately well defined and so also are the variations of climate to which they are exposed, hence the grouping of the villages into assessment circles is much facilitated. The rainfall on the whole may be described as fair in amount, although partial failures may be looked for from unequal distribution of the fall between the kharíf and rabi seasons. The figures supplied by the Mamlatdár for the last eight years show that with the exception of the famine year of 1876-77 the fall has been sufficient and sometimes plentiful. It must be remembered, moreover, that the register has been kept at the town of Bágalkot which is situated in the centre of the groups of villages and not in the position where the heaviest rainfall would be likely to be found. The most eastern villages undoubtedly share in the more plentiful late rains which form such an important feature in the climate of the neighbouring Táluka of Hungund.

6. The area given under each description of crop in Appendix B. shows that kharíf and rabi products are fairly equally divided, the former being grown in the light soils in the centre and north-west of the Táluka and the latter in the valleys of the Krishna and Ghatprabha and the black soil plains to the east. Excluding the area of fallow, which should not have been indiscriminately added to the rabi area, it will be seen that cotton is annually grown over about 14 per cent. of the cultivated land. There is much room for extension of the cultivation of this valuable exportable commodity and, should the opening of the railway which is now progressing towards Bágalkot be attended with a brisk export trade, much of the area now devoted to the white variety of "jowári" will be gradually placed under cotton. From my personal experience of the Táluka I should say that upwards of 40 per cent. of the total area is capable of producing the more valuable products for foreign export, while of the remainder there is a considerable area which can be placed under the better kinds of pulse and which need not be devoted, as now, to the cultivation of the more bulky products, which cannot be profitably exported except under extraordinary circumstances.

7. The chief town of the Táluka is Bágalkot which even in the time of the original settlement was a place of great commercial importance and which is now the most flourishing emporium of trade in the whole Kaládgi District. Its population according to the last general census was 12,850 of whom the majority were non-agriculturists and therefore valuable as consumers of the surplus food grains of the locality. Next in importance "*sed longo intervallo*" comes Kaládgi for some time past the Head Quarter of the Collectorate of that name. The Military Cantonment upon which this town mainly depended for its importance at the time of the original settlement has altogether disappeared; nevertheless a considerable local trade is sustained and the sales at the weekly bázár are said to

average Rs. 25,000. The other markets are inconsiderable. The manufactures of the Táluka are confined to the weaving of coarse cotton cloth for male and female attire; but the competition of foreign goods and the enterprise of the traders of Bágalkot in placing such goods in the market at cheap prices is slowly but surely driving this handicraft off the field.

8. In the matter of facilities of communication there has been considerable progress made since the original settlement, not only in the connection by roads of the chief marts of the locality but in the improvement of the means of access to the coast. The result is evident in the multiplication of carts which have increased from 140 to 1,769. In the black soil villages communication is easily kept up in the fair weather by means of country tracks, but in the hilly portions of the táluka cart traffic is dependent on the few made roads which intersect them and which are both difficult of construction and costly of repair. But the greatest improvement of all will be effected in the course of a year or two by the opening of the Eastern Deccan Railway which will run through the heart of the tract under settlement and cannot fail to cause an entire revolution in the course and direction of trade, as it will bring the villages into more or less rapid communication with those marts to which the raw products have hitherto been slowly and laboriously carried and by affording a ready market for all exportable commodities will be the means of pouring into the district a more plentiful and sure supply of the precious metals, without which any well sustained rise in the prices of produce can scarcely be expected.

9. The important subject of the condition of these villages in respect to population and agricultural stock is discussed in para 14. Seeing that the facts and figures of a specially careful village census taken in 1882 are available, I am disappointed that Mr. Fletcher has based his comparison on the figures obtained by the Revenue Survey classers, as the general unreliability and deficiencies of a census so carried out have been represented to Government and admitted to the extent that the duty has now ceased altogether to be performed by the Survey Department. Mr. Fletcher has himself been a classer for many years, and having doubtless supervised the work in his own establishment with that conscientiousness which is habitual to him is not ready to admit those defects in the system which appeal so strongly to outside observers, such as the impossibility for classers working on the partial system for a few days only in each village to carry out an efficient stock-taking and the want of uniformity in the season in which each village is censused.

10. The following table shows as far as possible the statistics of the special village census of 1882 for the 124 villages simultaneously settled as compared with the figures of the early settlement which, it must be remarked, were drawn up in a much more deliberate fashion than they could be now and by classers making a comparatively lengthened stay in the villages:—

	At former settlement.	Special Census of July 1882.	Increase.	Decrease.	Percentage.
Population ... ..	61,540	78,530	16,990	.....	+27·6
Agricultural cattle ...	15,352	20,353	5,001	.....	+32·5
Cows, buffaloes and their young ... ..	37,397	22,057	.....	15,340	—40·1
Sheep and goats ...	30,643	31,406	763	.....	+2
Carts ... ..	140	1,769	1,629	.....	+1,163
Horses and ponies ...	884	683	.....	201	—22·7

11. It will be seen that the special census figures show a very considerable increase in population, which is rather remarkable considering that the Bágalkot Táluka suffered to a very great extent from the famine of 1876-77. The only explanation I can offer is that between the early settlement and the famine popu-

lation must have increased very rapidly with the gradual development of the tract and that although the famine thinned the population greatly, the decrease caused thereby did not counterbalance the increase, to which the last few years of comparative prosperity has still further added. This explanation is borne out by the figures given in paragraph 2 of Mr. McCallum's report which, however, refer to the whole taluka, including Inám villages. I have no desire to under-estimate the catastrophe of the famine in the Bágalkot Taluka. It was a terrible blow to the country and a great check to its prosperity, but it is a strong evidence of the success of the expired settlement that so great a calamity should have been experienced and that yet there should be an appreciable increase in population and agricultural cattle over the number censused at its first introduction.

12. As regards the other heads of agricultural stock I have alluded above to the large increase in the number of carts which points to a complete revolution of the character of trade during the period of settlement. There is the same marked decrease in the number of cows, buffaloes and their young which was found in the neighbouring taluka of Hungund and which is due to a great extent to the famine, but also to a gradual diminution of this kind of stock which followed the cultivation of lands originally devoted to pasturage. The same cause tended to reduce the number of sheep and goats very materially, but I have frequently of late had to notice the great impetus which has been given to sheep breeding by the poorer lands being thrown out of cultivation and by the brisk demand for wool. The Bágalkot villages are no exception, for we find that the present number of sheep and goats is in excess even of the number at the first settlement by 2 per cent.

13. In paragraph 23 of Mr. Fletcher's report it is shown that only 58 per cent. of the fields are cultivated by the registered occupants, which is a proportion less than has been found in the recently re-settled Taluka of Hungund and in other parts of the Presidency. It is to be attributed, I think, to the presence for a long time past of a large non-agricultural community containing not a few enterprising capitalists. Such persons trading in a remote part of the Presidency and in the very midst of a cultivating population would not be long in discovering the advantages of land as an investment. It does not follow that the land has come into their hands through the debts and disabilities of the original cultivators, for it is believed that the rayats in these parts are not in the same involved condition as those of the Deccan. But when the Survey Settlement came into force and some 80,000 acres of waste land were made available for cultivation by comparative fixity of tenure and fixity of demand, the capitalist was on the spot and had the same opportunities which the rayat had of securing the occupancy of land.

14. The condition of the rayats of the tract to be dealt with is naturally one of the most serious questions to be discussed in a settlement report. I have already mentioned that the rayats of Bágalkot are not oppressed with hereditary debt like their brethren in other parts of the Presidency and I find that my opinion formed when I was Collector of this district is corroborated by an officer of the great local experience of Mr. J. F. Fleet in paragraph 11 of his Administration Report of 1876. But at the same time I do not shut my eyes to the fact that a considerable amount of land is changing hands because the holdings are insufficient to support those who have to subsist upon them or rather because the exigencies of the time require a higher standard of cultivation than the holders are able or willing to devote to them. And it must be remarked that this transfer of the land from the petty holder to the more thriving farmer or the capitalist is a transaction which is not confined to one tract of country, but is going on in every part of the Presidency where a "petite culture" is from the nature of the climate and country precarious and unprofitable. I cannot think that from an economic point of view the transfer is to be regretted, although there is a sentimental argument in favour of retaining on the land, as long as possible, a body of independent peasant proprietors. The opening out of the country by roads and railways, the demand for exportable products and the necessity for a more skilful husbandry to raise them, the competition of distant markets in the coarser food grains, the increase in the cost of certain necessities of life and the improved standard of comfort of his more fortunate neighbours—all combine to

render the position of the small holder one of great precariousness and anxiety. It would seem as if we were now passing through a phase which every agricultural country must pass through while its resources are being thoroughly developed. What is happening now in India apparently happened in England as far back as the sixteenth century, when the first burst of increased wealth and prosperity and the earliest introduction of the country to an export trade were sufficient to make the small yeomen as a class entirely disappear. It would be impossible for Government, even if justified by economic laws, to preserve the small farmers on their land and to successfully oppose the tide of change. Such a step as a lessening of the revenue demand, for instance, would only have the effect of increasing the selling value of the land and thereby placing an additional temptation in the way of the small farmer to get rid of the holding he cannot profitably cultivate. I think that there is no cause for apprehension in what is happening. Many of the small farmers whose descent to the position of day labourer is but a matter of time, are working harder, living in less comfort and more harassed by poverty and anxiety than the day labourer with his fixed and regular wage. It will probably happen in India as befel in England, where we are told that "the gradual divorce of the peasant from the soil which degraded him into the day labourer coincided with unabated and perhaps increasing prosperity in the higher orders of the agricultural community".\*

15. Regarding the facts which are offered as to sales, mortgages and leases, Mr. Fletcher makes some sensible remarks. His object is to show that from mere lists, such as are contained in his Appendices K, L and M, nothing more than a general idea can be obtained as to the value of land as an investment. It is a common fallacy among critics of Bombay settlements to compare the multiples of the assessment for which one piece of land is sold or mortgaged with the price realized for another piece of land and to condemn the survey valuation because the sale values are not in the same proportion to the assessments. It is scarcely necessary, however, to point out that the classification made by the Survey is a valuation of the natural productive capabilities of the soil only or, as it has been whimsically called, "its prairie value." Every improvement made by the occupant tends to increase the selling value of the land and its disproportion to the assessment, while even improvements made by Government are not permitted, except in exceptional cases, to modify the assessment within the period of the settlement. A piece of land, which in the year of settlement was in a village remote from even a country track, may a year or two afterwards by the opening of a Railway find itself in the proximity of a Railway Station. There will be no change in the assessment of the land until a revision of the rates in the vicinity, but there will surely be a material change in the value of the land in the eye of an intending purchaser.

16. Such being the case and as Mr. Fletcher has specially deprecated any great reliance on averages drawn from his statement of sales it is not easy to understand the necessity for Mr. McCallum's criticism contained in paragraph 5 of his paper of remarks. Still less is his attempt to reduce the importance of the figures justified by the circumstances. Mr. McCallum proceeds on the hypothesis that the lands shown to have been sold in Appendix K, may have been under-assessed or improved, and by a strange process of reasoning he considers that with these actually registered and accomplished sales an imaginary sale of all the arable waste land, which no one wants at present for cultivation, should be combined to strike a proper average. And in fixing a price for the occupancy of the waste land he takes the average proceeds of the sale of the grazing upon it for one year, forgetting apparently the great difference between the sale of the right to graze cattle on the land for a short period and the right to cultivate it for ever on payment of the Government assessment.

17. I now pass on to consider the Revenue history of the taluka as given in a tabulated form in Appendix P. This very useful statement shows at a glance the various phases of agricultural development through which the villages have passed since the introduction of the settlement. It would seem that the

---

\* English Land and English Landlords by the Hon. G. C. Broderick.

land was not taken up at first "at a bound" as was the case in Hangund and elsewhere, but that a sure and steady rate of annual progress was maintained until about 1863-64, which is suggestive of a very depressed condition of the rayat at the outset but a subsequent steady increase in his wealth and prosperity. After 1863-64 the area of occupation is more slowly added to until we reach the highest limit in 1877-78, the year after the famine, when all occupied land remained intact in the names of the occupants and those who would afford to do so would naturally be induced by the enormous value of produce even to extend their occupancies. I believe that Mr. Fletcher is correct in his inference that about the period of 1864 all the land of unquestionable rent-paying capability had come under the plough and that what was taken up after that date was land which would only be likely to pay a rent in years of high prices, such as those during and following the American war when such a remarkable fall took place in the value of the precious metals. Since the famine there has been a gradual process of disorgement of the lands which were taken up in those years of almost spurious prosperity and which are incapable of profitable cultivation when prices are oscillating in the manner they have done during the last decade. The process has been accelerated by the sudden fall in prices in 1880 to 1882 and has continued down to 1882-83, for which year I am now able to give the correct figures relating to the group of 124 villages :—

Area of occupied land	...	...	...	...	...	Acres 138,543.
Assessment of do.	...	...	...	...	...	Rs. 79,139.
Remissions	...	...	...	...	...	Nil.
Area of unoccupied land	...	...	...	...	...	Acres 13,610.
Assessment of do.	...	...	...	...	...	Rs. 4,225
Outstanding balance	...	...	...	...	...	Nil.

It will be observed that in this year there is a further diminution of 464 acres in the occupied area assessed at Rs. 112 or about 4 annas 8 pies per acre. No land of any great worth appears to be going out of cultivation and probably only that which has been a burden rather than otherwise to the occupants during the recent period of the low prices. The greater portion of the area of unoccupied land would probably be re-absorbed by a reversion to high prices, but the steady and continuous occupation of this land will only be brought about by its falling into the hands of improving occupants or its becoming an adjunct to large holdings.

18. The success of the past settlement may be fairly judged from the figures given in this table regarding the collection of revenue. Outstanding balances almost entirely disappeared after the year succeeding settlement and the whole demand was collected promptly and regularly until 1876-77, when about half remained unrealized. For three years subsequent to the famine considerable sums were outstanding; but the amount has diminished until, as will be seen from the figures in the preceding paragraph, there are no remissions and outstanding balances at all in 1882-83. The information given by Mr. Fletcher in his paragraph 27 regarding the measures adopted against defaulters show that in 1881-82 there were but 183 reminders issued and in 7 cases only had distraint to be resorted to. The ante-famine promptness and facility of realization of the demands seems to have returned in a very great measure.

19. I have now to deal with the subject of prices which is the most important of all. It is a consideration of prices which alone indicates the share of the increased value of produce which Government *might* take, while all other collateral facts are merely qualifying elements, helping to the still more important consideration as to what share Government *ought* to take. Mr. Fletcher has shown from a comparison of the figures of prices for the first decade of the period of settlement and the eleven years from 1871-72 to 1881-82 that the value of the staple products has more than doubled or in other words that the demand absorbs less than half the share of the cultivators' net produce which it did when the old rates were considered. But the fluctuations of prices have been so great of late years that it is difficult to obtain any appropriate period for a fair comparison. The prices of 1882-83, which I have collated from the price currents of Bágalkot market, show that the fall continued into that year and that

the average price of jowári was 35 sers and of wheat 21. There has recently been a more than corresponding rise and the average of the six months from April to September 1883 gives jowári at 29 sers and wheat at  $19\frac{3}{4}$  sers. If we compare the current rates with the average rates of the first decade we find the following :—

Product.	Average Sers per Rupee from 1851-52 to 1860-61.	Average Sers per Rupee in the last 6 months.	Increase Sers.	Percentage Increase.
Jowári ... ..	47	29	18	62
Wheat ... ..	32	$19\frac{3}{4}$	$12\frac{1}{4}$	62
Gram ... ..	29	19	10	52

Although, therefore, going upon the averages of certain periods the increase of value shown is 100 per cent. and upwards, it would be dangerous to assume as the basis of the revised rates any such very favorable calculation. As far as can be judged at present the opening out of the railway should result in the steadying of prices on a high level, but experience has shown that even in districts to which Railway communication has been extended sudden falls cannot be avoided. As every settlement to be just should take into consideration the level to which prices may fall, I think it scarcely safe to claim a general increase in the value of the chief cereals and pulses of more than 66 per cent. For cotton, however, a considerably greater increase may fairly be accepted not falling short of 100 per cent.

20. The grouping of the villages into assessment circles and the maximum rate to be applied to each which are specified in paragraph 29 were discussed personally between Mr. Fletcher and myself and I would strongly recommend them for acceptance by Government. The original estimate of the variations in climate within this tract made by Captain Wingate has been justified by further experience and in very few cases has the grouping arranged by him been departed from. It is true that communications subsequently opened have to a certain extent altered the condition of things and that the Railway now under construction will effect a still greater change, but in a country like Bágalkot and in carrying out a system of assessment mainly founded on the productive capabilities of the soil the climate must be the chief consideration. There are wide stretches of soil suited only for kharíf crops. Here and there a dependable rain-fall causes the land to fructify annually ; but in villages where the early rains are capricious there will frequently be but little to employ either road or Railway. And still more so with the rabi tracts. Marshall, the Statistical Reporter, writing in 1820 says of Bágalkot : “ Were the black soil to be as certain of its appropriate quantity of moisture as the lands of Broach and Surat usually are in “ believe it would be one of the most productive tracts in the world and were it “ also all in tilth (a speculation almost as theoretical as the former) would be “ capable of feeding a population twenty times greater than that which now “ inhabit it.”

21. The villages now being dealt with were divided by Captain Wingate into four groups and the map accompanying the report will show that four groups are virtually retained. The town of Bágalkot is singled out for a higher maximum rate of assessment, viz. Rs. 1-10 because in addition to a good climate it possesses superior advantages in the way of roads, it will soon be the most important Railway station between Sholápur and Hubli, its lands bear a distinctly high value which must still further increase and its cultivators owing to the immediate proximity of a market for their produce and the cheapness of manure are very favourably situated. Four villages adjoining Bágalkot which are well off both as regards climate and proximity to the railway are selected for a Re. 1-6-0 maximum rate and form a second group. The third group with a maximum rate of Re. 1-4-0 includes the town of Kaládgi and comprises 49 villages in the Ghatprabha valley

chiefly to the south of that river, enjoying perhaps the most even climate in the taluka, fairly provided with communications and conveniently situated for Bágalkot. The fourth group, comprising 49 villages also, lies to the north and north-east of the villages of the third group. It contains the market town of Bilgi and will bear a maximum rate of Rs. 1-2-0. These villages are considered to have equal advantages on the whole, some having an inferior climate but fair communications and others having a more reliable climate but worse off as regards accessibility to Bágalkot, the great focus of trade. The last group consists of clusters of villages to the north of the taluka which have a less satisfactory climate added to want of roads and difficulty of intercommunication. Each group is distinguished on the map by coloring, Inám villages being left untouched.

22. The revenue derived from rice and garden land has always been and still is very trifling. The maximum rate for the small area which is classed as rice has been fixed, as in Hungund, at Rs. 8, but the resulting average rate is only Rs. 2-11-0 per acre. There is no Pátasthal or water-channel irrigation in the taluka, the small streams being unsuited for it. The entire garden area is under wells which have been treated according to the liberal principles observed in revision settlements and bears an average assessment of Rs. 1-7-10 per acre. As pointed out by Captain Wingate in his settlement report of the 9th June 1852 there are several localities on the chief rivers where works of irrigation might be constructed with very great benefit to the country. The Irrigation Department is active in the Kaládgi District and attention will doubtless be directed in good time to the protection of Bágalkot by canals as well as by railway. The Muchkhandi Tank recently constructed is a great improvement, commanding 5,200 acres.

23. The general result of the imposition of the above rates will be an immediate increase to the Government revenue of Rs. 22,282 per annum or 27·9 per cent. and it will be seen from Mr. Fletcher's table in paragraph 32 that the increase is very fairly distributed over all the groups, the highest increase in any single group being only a fraction over 33 per cent. The arable unoccupied land available for extension of cultivation is 14,567 acres or 9·2 per cent. of the whole arable area, and being assessed on an average at Re. 0-5-6 per acre leaves room for an increment of revenue of Rs. 5,013. The average rate per acre for all kinds and descriptions of land will become Re. 0-11-5 per acre as against Re. 0-9-1 under the expired settlement. The increase will be Re. 0-2-4 per acre.

24. I must here proceed to notice the Acting Collector Mr. Muir's criticisms which I take to be directed not against the moderation of the proposed assessment, which he appears to admit, but against the structure of the report and the basis upon which the proposals have been founded. The gist of Mr. Muir's observations is that the report is deficient :—

1st.—Because it contains no explanation as to what percentage of the profits of cultivation has in time past belonged to Government in theory and in practice.

2nd.—Because it is silent as to the percentage of those profits which could fairly be claimed at the present time as the property of Government, and

3rd.—Because it is not clearly shown why, when the value of agricultural produce has doubled during the period of the expired settlement, 27·9 per cent. has been fixed upon as the particular measure of enhancement.

25. As regards the first objection I think Government will agree with me that, however interesting and useful it might be in an original settlement report to trace the various revenue systems which have gone before and the manner in which the country flourished or deteriorated under each successive system, it is not necessary to go over the same ground in making proposals for a revision settlement. When the sole object is to fix what modifications of a former British settlement have to be made, it would scarcely be relevant to go back to the teaching of Manu as to the State demand or to describe the share of the

produce claimed by the old Hindu dynasties, the commuted cash assessments of the Mogul or the arbitrary exactions of the Marátha. Nor would it be profitable to discuss the vexed question as to whether our assessment is a tax or a rent or a due. It is sufficient to state the principle which lies at the root of the Bombay settlement system that the assessment is to be a charge on the true rent of the land and that in fixing the amount of the assessment, whether under original or revision settlement, one of the main objects is to leave with the occupant of the land a very considerable portion of its true rent.

26. With reference to the second objection I would go still further and venture to say that if Mr. Fletcher had pretended to found his assessments on any theoretical or practical share of the cultivator's profits he would have introduced an unauthorized innovation into the system of which he is an exponent. A perusal of the well-known Joint Report of 1847 will satisfy Mr. Muir that the Bombay system, while taking into comprehensive consideration every subject upon which other revenue systems are founded, binds itself by no engagement to take any theoretical proportion of the gross or net produce of the land. While the difference of land tenure renders it almost impossible to proceed, as in Upper India, on the direct basis of actual and estimated rentals, the difficulty of ascertaining the true rent of land under a rayatwari system and the wreck of Mr. Pringle's settlements which attempted to do so have given us good cause to avoid the more complicated system of Madras. It is mainly this characteristic which has caused our system to be called an "empirical" one, but experience has shown, and it is for Government to show in future, that the benevolent empiricism of the Bombay system will compare favourably in its results with any of the hard and fast principles of assessment which have been adopted in other parts of India.

27. As regards Mr. Muir's third objection I have only to say that it has been fully accepted as a principle of the revenue system that there should be no attempt to enhance assessments in arithmetical proportion to a rise in prices. The violent fluctuations in prices which have lately been experienced compel us to accept a comparison with the early years of the settlement with great caution, and the danger of proceeding literally on such a comparison has been too surely demonstrated. It was a consideration of this danger that induced the Government of Bombay in 1874 to prescribe to its settlement officers a limit of enhancement on a single group of villages of 33 per cent. and, as Government are aware, the advisability of keeping any periodical enhancement on account of prices alone under 15 per cent. has been recently mooted and discussed. Mr. Muir asks how the figure of 27·9 per cent. has been arrived at, and I answer that it is the direct result calculated to accrue from the moderate increase of the maximum rates, which from a consideration of all which has been discussed in this report appears to be justified, together with a small increase on the area which formerly escaped assessment but which is now assessed. There has been no kind of manipulation in arriving at these figures: on the contrary the process is simplicity itself. Perhaps it might be argued that in these villages an increase up to the full limit of 33 per cent. might strictly be demanded and it would be easy for me to raise the maximum rates so as to reach that figure; but, in a tract comparatively remote and undeveloped and containing an agricultural population with an admittedly low standard of comfort, that slight foregoing of the strict demand which has carried the original settlements safely over many a season of drought and failure and landed them in success should in my humble opinion form a feature of revision settlement as well. I consider, moreover, that an increase of the average rate per acre of 2 annas 4 pies is sufficient to mark an enhancement of the rates at this particular period of development.

28. If it be admitted that the proposed increase to the rates of these villages is sufficient and suitable for the next period of settlement it remains to be considered whether the full revised rates should be at once levied or whether, as in the case of the Hungund Taluka, a remission on the revised rates should be given for any short period to pave the way for the full levy. It appears to me that advantages and disadvantages are so evenly balanced in both tracts that any concession made to the one may fairly be made to the other also. If Hungund has soils of intrinsically greater value than Bágalkot the latter is shown to be somewhat better off in general resources and means of cultivation. But there are two

From

J. FAIRLIE MUIR, Esq.,  
Acting Collector, Kaládgi District ;

To

THE SURVEY AND SETTLEMENT COMMISSIONER.

*Bijápur, 7th September 1883.*

SIR,

I have the honor to acknowledge the receipt of your letter No. 1765, dated 11th ultimo. You direct me in it to submit to you "with as little delay as convenient, the revision settlement report of the Bágalkot Táluka"—the report "to be submitted in time to obtain the orders of Government."

2. I lose no time, therefore, in forwarding this report to you. I am not aware by what date it ought to reach you ; but it has, apparently, already been detained too long in my office. This report, No. 680, dated 30th June last, was sent by Mr. Grant, my predecessor, to  
\* Assistant Collector in charge of the táluka. Mr. McCallum,\* who was asked to give his opinion about it. Learning this on enquiry, on receipt of your letter, I requested Mr. McCallum to return it to me without delay. I received the report back from him only on the 1st instant.

3. I have perused the report, but have not been able to give to its study the time and attention that a question of such importance demands. And, in any case, my opinion about it would be of little or no value, seeing that I have not been able to refer to the correspondence about the original settlement and the Government orders thereon. The reasons for this I need not go into here. Further, I have not the local knowledge to enable me to form an opinion of value ; my acquaintance with the district has been only of a few weeks' duration. I pass on the report to you at once, all the more readily, as it is, in my opinion, deficient on several points in information necessary to enable one to judge of the expediency of the proposals made therein.

4. These "proposals" are "for revision settlement of 126 villages of the old Bágalkot Táluka." \* \* "The proposed increase on the Government occupied lands is, it will be seen, Rs. 22,282, or 27·9 per cent." The questions for disposal are—whether the proposed rates of assessment are (I) fair as regards the interests of the State, and (II) equitable to the cultivator. The report does not seem to me to dispose of either question exhaustively or, even, satisfactorily.

5. (I) *As regards the interests of the State.* The assesment in question is not a tax proper. By immemorial prescriptive right the State is entitled to a portion of the rent proper of all land not alienated by it ;—i. e. to a percentage of the profits of the cultivation of this land. In a report of the kind, now made, some attempt to define these rights of the State—as part-holder of the land—might, therefore, not unreasonably be looked for. One wishes to learn from the report, in the first place, what percentage of these profits has, in time past, belonged to Government—(1) theoretically and (2) in practice. The report might, then, state what percentage could fairly be claimed, *at the present time*, as the property of Government.

6. This matter was doubtless gone into when the proposals for the original settlement, effected 30 years ago, were made. But, nevertheless, it surely ought not to be ignored—as it is—in the proposals for the revised settlement. The report tells us, certainly, the rates of assessment, settled 30 years ago. But it leaves us in doubt as to what percentage of the profits of cultivation these represent ; and as to whether this percentage is the full amount that the State (as part land-holder) is entitled to claim.

7. I consider, then, that it is essential, in a settlement of the land revenue, to lay down, in the first place, what the rights of Government are—what percentage of the profits of cultivation is its due. This limitation of its dues—this standard of its claims—must be learnt before we can proceed further. How far these claims should be enforced is, of course, quite a separate question. My contention is shortly this—that the report in question makes no attempt to define the percentage of the profits of cultivation that Government is entitled to. This, I hold, vitiates the proposals, *ab initio*.

8. Not only this; but the report does not state—nor, indeed, refer in any way to—the percentage of the profits of cultivation that it is now proposed to take. How, then, can one judge whether the State has been fairly treated?

9. Absolutely we cannot—we can do so relatively, however, for we have the original survey rates with which to compare those now proposed. But, here again, the report is at fault.

10. The original rates were fixed as representing the money value of the State share of the net produce of the land. This share,—whatever the amount was that was then claimed,—is the same now that it was 30 years ago. Nevertheless its money value has greatly increased. Granted that the amount of the share was definitely fixed 30 years ago, and that, then, the Government claims were pressed to the full—the State is now, in all justice, entitled to the present full value of this amount; enhanced, as it is, by the relative fall in the value of money.

11. We require, then, to know the prices of raw produce that ruled 30 years ago, and on which the original rates were fixed. But this information is nowhere to be found in the report in question. Further, though the prices of raw produce are given in the report for the last 30 years, yet no estimate is offered of the prices that rule at present, and of those likely to rule for some time to come.

12. From the prices given, however, (as stated above) for the last 30 years it would seem that the money value of raw produce has, at least, doubled within the period of settlement. Why have the rates of assessment not been enhanced in proportion? Their increase is only 27·9 per cent. Why have the State dues thus apparently been foregone? I do not say that the State share of the raw

produce,\* that was exacted 30 years ago, ought now to be claimed. But I do think that some explanation is called for;—as to why a portion, only, of this share is now claimed. The dues of the State—of all persons not cultivating or holding unalienated land—have, apparently, in part been foregone. Why is this?

13. Then (II) *the rates must also be equitable to the agriculturist*. They must, in his interests, be kept as low as is consistent with the just claims of the State—the part land-holder. Whether 30 years ago these claims were pressed to the full does not appear. But, granted that they were—*i. e.* that the portion of

raw produce\* then taken was the full amount of the dues of the State—it follows that the same portion\* should now be taken. That is, it should so be taken, unless there be good reason to the contrary.

14. First, we have to look at the condition of the country—the density of the population, the affluence of the agricultural class, the sufficiency of agricultural stock, &c.—now-a-days as compared with its condition at the time of the original survey. No doubt, during the intervening 30 years, great changes have taken place. The condition of the country has at times improved; at times it has fallen back. The result, however, is apparently in favor of the agriculturist; the condition of the country is apparently now more flourishing than it was at the time of the original settlement. The famine of six years ago impoverished the country; but the District has now fairly recovered itself, so far as I can learn. At all events, there can be little doubt but that, in the ordinary course of events, it will more than recover itself within the next few years. Against the loss, caused by this calamity, must be credited the improvement in the condition of the agriculturist caused by the rise of prices that followed the American War, the opening out of the country by roads and railways, &c. The

money value of the raw produce, left with the agriculturist after the deduction of the Government share, has in consequence greatly risen. The balance is well on the credit side. There is no reason then, on this account, that what was estimated 30 years ago as the fair amount of the State dues should now be cut down. The amount of the net produce, then taken, may now be fairly claimed—if indeed it be not increased—as far as the condition of the agriculturist is concerned. And, if this holds good as regards the net raw produce, it follows that its money value (higher or lower, as the case may be, than it was 30 years ago) is similarly claimable from him.

15. But another point remains to be considered. It is, no doubt, the right of the State to claim the present money value of this share of the net produce. But is it advisable to do so? *Eventually* and by degrees the whole of this money value ought *certainly* to be claimed. For the present, however, it is expedient to take only a portion of the increase. It is expedient to do so, because any great rise in the amount of the assessment (especially as it is paid in money) would seriously disturb the standard of comfort that now obtains in the home of the agriculturist, and so would interfere with the general welfare of the country. During the 30 years the rates of assessment have practically been falling; the agriculturist has, year by year, had more of the net produce at his disposal. This is so, because year by year a smaller portion has sufficed to pay the money demand of the State—the part land-holder. The State does not wish to throw him back; but, in justice to itself, it cannot relinquish its rights.

These must now be clearly asserted; though, at the same time, they should only gradually be enforced. It appears expedient that in such cases some regular scale of enhancement should be followed. This rate might well be fixed at one anna in the rupee—6·25 per cent.—after every five years; until the full amount of the money value of the State share of the net produce be reached.

16. I am conscious that I have now written at too great length. Want of leisure, in my desire to forward the report on to you as soon as possible, is the reason why I have not expressed myself more tersely. I trust, then, that the error may be condoned. To sum up, I contend that the report, now submitted, does not contain the information necessary to enable Government to pass final orders on the proposals made. I have explained in some detail the major points, about which the information is, in my opinion, deficient.

I have the honor to be,

Sir,

Your most obedient Servant,

J. FAIRLIE MUIR,

Acting Collector.

सत्यमेव जयते

# REVISION SETTLEMENT OF THE BA'GALKOT TA'LUKA OF THE KALA'DGI DISTRICT.

*Copy of letter No. 428, dated 27th August 1883, from Mr. E. McCallum, First Assistant Collector, to the Collector, Kaládgi District.*

*Notes made thereon by Mr. J. Fairlie Muir, Acting Collector, Kaládgi District.*

With reference to your No. 3052, dated the 10th ultimo, I have the honour to state below, my opinion on the subject of Mr. Fletcher's No. 680 of the 30th June last to you :—

2. The figures in paragraph 14 only refer to 124 out of 174 villages in the táluka, and include the two largest towns, *viz.*, Bágalkot and Kaládgi. The population of Bágalkot is chiefly engaged in trade and suffered little by the famine. It does not follow that because in these villages there has been an increase of population of 9·3 per cent., there has been an increase of the whole táluka.

To show the loss of táluka caused by the famine, I show the population and number of cattle in 1875-76 and 1880-81 :—

	1875-76	1880-81, taken from Táluka Form No. 34 compiled from the Village Census taken at the end of July 1880.	1881. Imperial Census.
Population .. .. .	169,534	91,773	96,798
Cattle, male and female ..	57,044	36,772	.....

This is beside the question at issue. The proposals, made by the Superintendent, are with reference only to these 124 (or rather 126) villages. With the population, then, of these we are alone concerned. It is immaterial whether or not "there has been an increase of the whole táluka."

I have not verified these figures. The terrible loss, caused by the famine, is admitted on all sides. Still, it may be held that the condition of these villages is as flourishing now, as it was at the time of the settlement; and that, in a few years, it will become much more so. There has been an increase in population of 9·3 per cent.; a decrease in the number of agricultural cattle of 2·9 per cent., and of cows, buffaloes, &c., of 41 per cent. Doubtless, the more valuable cattle have survived; the sickly and worthless have gone. The curtailing of free grazing during the 30 years and the high prices of fodder in the famine readily account for this decrease. Nor is the loss of the more worthless cattle, by any means, an unmitigated evil.

3. Para. 18.—The number of agricultural cattle may be sufficient for the land actually cultivated; but I have been informed by the ryots all over my charge that the quantity of land lying waste is due to the want of men and cattle to cultivate it.

Agricultural cattle are sufficiently numerous. Further, as their numbers are, *now*, only 2·9 per cent. less than at the time of the last settlement, and as there is every reason to believe that they will soon increase, this furnishes no ground for claiming, *now*, a less proportion of the profits of cultivation than was exacted then.

4. Para. 22.—If the conclusion drawn from the number of persons able to read and write and under instruction is that the position of agriculturists is such that they can afford to send their children to school and replace them by

Education has made satisfactory progress during the 30 years. This is one of the proofs, of the flourishing condition of the country. If its condition is flourishing—if its condition is as satisfactory at the present time

hired labour, I think it is wrong, the great proportion of children at school are in Bágalkot, Bilgi and Kaládgi and in those towns belong to the non-agricultural classes. When visiting schools about harvest time, I usually find a considerable number of boys on the register absent, the reason given being that they are watching crops or helping to get in the harvest.

5. Para. 24.—The statements showing the multiples of the assessment for which land is sold, mortgaged or leased, are given as ‘impressing one with the high value land bears in this táluka.’ I do not see how the conclusion can be drawn. There seem to me to be three reasons why some land should sell, let or be mortgaged for a greater number of times the assessment than other land: (1) it has been improved by the occupant; (2) since the original assessment in 1851, the circumstances have been changed by, for instance, a new market being opened or communications with former markets being improved; (3) the original assessment was unequal, and the land sold for, say 10 times the assessment, was assessed much less than it should have been compared with land sold for five times the assessment. In the first case the high value of the land is due not to a low assessment but to the improvements made by the occupants, which should not be a ground for increasing the assessment. As for the change of circumstances as regards the position with regard to markets, &c., the only change that I can find on enquiry to have taken place is the improvement of external communications, as the roads to Sholápur and the coast; and these improvements would affect the whole táluka almost equally and could not cause such a range in the letting value of the land as we find in the Appendix K, viz., from 1·4 to 54·5 times the assessment. I cannot find that any such changes as those referred to have taken place within the táluka or adjacent to it. No new markets have, as far as I can learn, been opened. There are very few local roads kept up by public funds, and even if they have been constructed since 1851 they cannot affect local traffic much. Carts can go along a country track in this táluka almost as well as along a made road in dry weather. There is very little rain to make the roads heavy: the people are seldom if ever in such a hurry as not to be able to wait till the cross country

as it was 30 years ago—then, *prima facie*, the proportion of the profits of cultivation, taken 30 years ago, may now fairly be taken.

The same inference as above may, here, be drawn. Appendices K, L, M, show the high value, that land, paying the original rates of assessment, has acquired. Government is entitled to share in the increase of the money-value of the profits of cultivation of this land.

roads are passable, and the greater part of the local trade as bringing grain to market is done by women who carry it on their heads, and it makes very little difference to them whether they walk along the made road or foot-path across fields. As regards the third case, *viz.*, the inequality of assessment, the Survey Department would be taking advantage of their own wrong if they made the fact that a small portion of the land in the táluka owing to its being underassessed sells on an average for several times the assessment, the ground for concluding that the land generally sells for so many times the assessment.

Take Appendix K. for instance; from 1878 to 1882 land paying Rs. 761 assessment was sold for on an average nearly 12 times the assessment. These are only the sales registered which were undoubtedly not all the sales. No statistics can be had of the sales not registered. But during the same years there was (Appendix P.) waste land assessed as below :—

Years.		Assessment.	Sale of Grass.
		Rs.	Rs.
1877-78	...	1,237	1,151
1878-79	...	1,249	750
1879-80	...	1,706	840
1880-81	...	4,044	706
1881-82	...	4,122	746
		12,358	4,199
Average assessment of waste for the five years..		2,476·6	839·8

In calculating the selling value of the land in the táluka this waste should be taken into consideration. Thus in Appendix K. land assessed at Rs. 761 sold for Rs. 7,548 or about 9·9 times.

Supposing the waste land had also been sold and the auction bid was equal to once the assessment, we would have land assessed at—

Rs. 761 sold for Rs. 7,548.

Rs. 2,476 sold for Rs. 839·8.

which would make the average letting price only about 3·3 times the assessment. It is not fair to take as a sample of the whole táluka a very small portion of underassessed or improved land (Rs. 761 being a very small portion of the total assessed area. Even of these 124 villages which is Rs. 84,000) and to leave out of consideration the waste. Of course I presume that the information contained in

Appendices K., L. and M. has been collected in order to justify the increase in the assessment of the táluka, otherwise I do not see why it appears in Mr. Fletcher's report. My remarks about Appendix K. apply equally to Appendices L. and M.

6. Para. 25.—I think in calculating the averages of the last three decades the abnormally low prices of 1851-52, 1852-53 and 1853-54 should be left out. Mr. Fletcher excludes the abnormally high prices of 1864-65, 1865-66 and 1877-78. Excluding the abnormally low and high prices the average of the three decades would be for jowári:—

1851-52 to 1860-61.	1861-62 to 1870-71.	1871-72 to 1880-81.
37·7	26·	24·

showing a rise of only about 50 per cent. instead of about 100 per cent., as shown by Mr. Fletcher's figures.

I look with great suspicion on the prices given in Appendix P. for the first three years following the introduction of the original survey assessment; it is strange that they should have been years (a) of such plenty as never to have been at all approached in the subsequent 27 years. I have questioned a very intelligent person here, the Secretary of the Municipality. He is 53 years of age and belongs to Bágalkot and was living during these years of plenty, but informs me that he never remembers the jowári being any thing like so cheap as jowári in Appendix N., and that to the best of his belief the price only averages about 8 seers the rupee more now than it has done as long as he can recollect.

(a) There is nothing to show that these were years of abnormal plenty; nor that the harvests have not been as good during the years, that have followed—with the exception of a year or two. Low prices ruled in these three years; as they doubtless ruled in the years before the settlement. But they soon rose. Not, because the harvests in after-years were less bounteous; but, because the development of the country threw open more profitable markets. The glut in the local market—the only market practically available—caused this so-called “plenty.” The low prices of three years (if wages were not low in proportion) would benefit the *non-agriculturists*. But to the agriculturist, the subsequent rise in prices was *all* gain. It is him that the wondrous changes of the thirty years have specially benefited. In the “years of plenty” the agriculturist's produce could not find *its way to the sea* otherwise than on pack-bullocks. The carts—665 per cent. less in number than they are now and these too singularly unwieldy—shared the *local traffic* with the pack bullocks; but for want of roads could only be moved in the fair weather. All is now changed. Good roads and the railway are our guarantee that the “years of plenty” will not return.

7. In his report on Hungund Mr. Fletcher, as far as I recollect, estimated cotton to be twice the price in Bombay now than it used to be in 1851. It does not follow that it fetched twice the price in Bágalkot. If my estimate of the rise in the price of jowári is correct, the rise in the price of cotton on the spot would probably be only about 50 per cent. or land would be diverted to growing the more profitable crop.

8. Para 28. Mr. Fletcher thinks we may confidently look forward to a period of prosperity unparalleled in the past. What the effect of the Railway may be on this táluka remains to be seen. There can be no doubt it will immensely benefit the district as a whole : it may possibly injure the circumstances of the cultivators in this táluka by bringing into competition, to a greater extent than at present, the produce of the rich Don valley with that of the táluka, in the market of Bágalkot to the advantage, of course, of Bágevádi Táluka, but the loss of Bágalkot. Even now much jowári is brought to Bágalkot for consumption, by road, and when the railway is open this quantity will certainly much increase.

No signs of recovery are yet apparent as shown by the following statistics of the táluka :—

Unoccupied	}	1880-81, 1881-82, 1882-83.
assessed land.		Acres 13,819, 13,655, 14,217.

so that though we are now six years past the famine the waste has increased instead of decreasing: 562 acres have been thrown up during the past year.

I beg to refer you also to my report No. <sup>270</sup><sub>1 confdl.</sub>, dated the 19th June last, on Hagnur village in Bádámi Táluka and to call your attention to the large amount of waste there. The assessment (a) was greatly enhanced in 1873-74 and it is difficult to tell whether the large amount of waste there is due to the famine or to the enhancement. The people themselves state the land was thrown up in consequence of the famine but the increased assessment may have a great deal to do at least with its remaining waste. The famine came so soon after the introduction of the revised assessment that it is difficult to trace the causes: I think then

The rise in prices in Bágalkot would, of course, not be *in proportion* to the rise in the Bombay prices. But the whole amount of the rise in the Bombay prices would certainly find its way, sooner or later, into the pockets of the Bágalkot agriculturist. More land is, doubtless, now devoted to this profitable crop—*i.e.* more land now than 30 years ago. The Superintendent's report is deficient in not going more fully into this important matter.

The Superintendent's language is, in my opinion, fully warranted by the circumstances of the case. The condition of the agriculturist cannot but greatly benefit by the opening of the railway. Even, if, as suggested, it lowered the prices of the *ordinary food-grains*, this would not be an unmixed evil to the agriculturist;—seeing that he is a consumer, as well, and a hirer of labor. But the market, opened out by the railway, cannot, in any case fail to profit him by raising the price of cotton and other exports of value.

I have not verified these figures. It is sufficient for our present purpose to know that\* the amount of land now under cultivation is not less than it was at the time of the original settlement. It has increased since then by 0.2 per cent. There is, further, every promise that it will shortly, greatly, increase.

(a) The meaning of this passage is not clear. I have asked Mr. McCallum to explain it further.

that the enhancement proposed by Mr. Fletcher is not justified by the state of the taluka which, as Mr. Fletcher admits, is now back (a) to where it was in 1864. Why the enhancement is fixed at 27·9 per cent. rather than at 10 or 20 per cent. there is nothing in the report to show. The holdings for the most part are very small and even at the present rate the occupants have enough to do to make both ends meet; an increase of over four annas in the rupee will bear very heavily on occupants paying Rs. 10, 15 or 20 a year which, as far as I can judge from the receipt-books, is about an average sized holding.

I have, &c., &c.,

(Signed) E. McCALLUM,  
First Assistant Collector.

(a) But yet it is more flourishing, perhaps, than it was in 1851-52;—at

\* Taken during the 30 years of settlement. which time the money-value\* of the State-share in the net raw produce was fixed.

I agree, however, with Mr. McCallum in what he states in the next sentence. I can find nothing in the Superintendent's report to explain why the particular rate of enhancement, stated, was selected. He fully proves that a large enhancement is justified. Why has he selected a rate of 27·9 per cent? The portion of raw produce, taken by Government 30 years ago, was now doubled in money-value; the condition of the country is prosperous. Why stop at 27·9 per cent? It is of paramount importance that we should know the reasons. They are not given.

J. FAIRLIE MUIR,  
Acting Collector.

No. 4029 of 1883.

*Bijapur, 17th September 1883.*

Forwarded to the Survey and Settlement Commissioner in continuation of my letter No. 3880, dated 7th instant.

2. Mr. McCallum is the Assistant Collector in charge of the Bagalkot Taluka. His opinion carries weight; as he has served in the District for the last  $2\frac{1}{3}$  years and has been in revenue charge of the taluka in question for  $1\frac{3}{4}$  year.

J. FAIRLIE MUIR,  
Acting Collector.

No. 680 of 1883.

FROM

W. M. FLETCHER, Esq.,  
Superintendent, Revenue Survey, S. M. C.

TO

THE COLLECTOR OF KALA'DGI.

*Survey Superintendent's Office,  
Dhārwar, 30th June 1883.*

SIR,

I have the honor to submit proposals for the Revision Settlement of 126 villages of the old Bāgalkot Tāluka, 124 of which were settled in the year 1850-51, under the Government Resolution noted in the margin; the remaining two \*being subsequently settled, now fall in for revision with those first mentioned.

Government Resolution  
No. 6287 of 27th September  
1852.  
\*Yelguti in 1859-60, Achuta-  
pur 1866-67.

2. The partial remeasurement system, explained fully in former reports and approved by Government, has been applied to the full extent in the villages under report, though it has happened that in 28 villages, from their small size and other reasons, a complete remeasurement was found to be more economical. In the 98 villages partially remeasured

Remeasurement.  
†Government Resolution  
No. 2388 of 5th May 1880.

Old Nos.	New Nos.	Acres.
5,296 remeasured became	7,523	= 113,765
8,281 confirmed	8,281	= 162,998
<u>13,577</u>	<u>13,804</u>	<u>276,763</u>

In the other 28 villages, wholly remeasured, 2,369 old Nos. became 3,046 new survey Nos; so that in the whole 126 villages under report, the process of measuring separately all existing occupancies, breaking up all holdings of excessive size and, so far as practicable, separating Government from Inām land, resulted in converting 15,946 old into 18,850 new survey numbers.

3. Details of the differences in area found in individual fields are given in the subjoined statement :—

Villages.	Total old survey Nos.	DIFFERENCE.						Nos. included in village site, hill lands, &c.	Nos. not remeasured.
		Within 1 per cent.	2 to 5 per cent.	6 to 10 per cent.	11 to 15 per cent.	16 to 20 per cent.	Over 20 per cent.		
126	15,946	2,611	3,466	733	214	113	218	310	8,281

It appears, therefore, that in 17 per cent. of the 7,355 remeasured Nos. the difference in area exceeded 5 per cent., which is about the proportion which experience in the Hungund Tāluka would lead us to expect in a district similarly traversed by large rivers.

In the next table the causes of the differences found to exceed 15 per cent. are indicated.

Causes of difference.

Total Nos. in which Difference exceeded 15 per cent.	Nos. IN WHICH DIFFERENCE WAS DUE TO			
	Alluvion and Diluvion.	Alterations in made roads.	Mistakes in Original Survey	Other reasons.
331	262	27	18	24

4. The reclassification was carried out on the same system as has been followed in all recent revisions, and the proportion of old Nos. reclassified in the field was as follows :—

- (1). Of fields whose old classification exceeded 10 annas 6 pies, 10 per cent. of the first and 5 per cent. of subsequent hundreds.
- (2). Of fields whose old classification was less than 10 annas 6 pies, 20 per cent. of the first and 10 per cent. of subsequent hundreds.
- (3). The minimum number of fields reclassified in a village was 7.

This operation, while affording a basis on which to adjust the whole of the old classification to the standard desired, showed that here, as elsewhere, the range of values needed widening; this has been done by raising the classification rate of the better soils, or lowering that of the poorer, according as the test taken showed either operation to be necessary, and by this means any increase of assessment, which Government may sanction, will be made to fall in larger proportion on the better soils.

In the 126 villages coming now under revision \* 3,375 Nos. containing \* 18 per cent. † 14 per cent. † 43,965 acres were reclassified in the field, while in † Roads, nálas, village sites, 15,509 Nos. and ‡ 2,64,827 acres the old classification was adjusted. ‡ c., are omitted from this figure.

5. In the following statement the area by the former survey is contrasted under heads of cultivation with that now obtained.

	Former Survey.	Revision Survey.	Difference.
Arable Dry Crop	2,50,317	2,52,636	+2,319
Rice ...	111	125	+14
Garden ...	310	499	+189
Unarable, Hills, &c. ...	70,688	68,826	-1,862
Total ...	3,21,426	3,22,086	+660

The revised area is, therefore, in the lump approximately identical with that of the first survey, the difference being only .2 per cent., although the internal discrepancies are for the reason above indicated considerably above the usual proportion. The inference is plain that the old survey was accurate on the whole, and quite worthy to be utilised largely as the basis of the new.

6. Upwards of 2,000 acres formerly recorded as unculturable have now come under the arable head, while there is some increase in both garden and rice areas; irrigation, however, is very unimportant in extent, and from the conformation of the country can never be otherwise, till the Krishna or Gatparba are utilised on a large scale.

7. Bágalkot is the central Táluka of the Kaládgi Collectorate, and contains, besides Bágalkot itself, the next most important and populous town in the district, the head-quarter station of Kaládgi. The Táluka is bounded on the north by the Krishna, beyond which lie the Bágevádi, and Muddebihál Talukas of this district, while to the south and east it adjoins the Tálukas of Bádámi and Hungund; on the west it marches with the Native State of Mudhol.

Besides the Krishna on its northern border the tract under report is watered by the Gatparba, which entering at the south-west corner flows nearly due east as far as Bágalkot, then turning suddenly to the north forces its way through a small range of sand stone hills, and joins the Krishna.

8. The valley of the Gatparba is comparatively narrow, but contains much excellent black soil in its bottoms: the central, and by far the larger portion of the Táluka, is poor and

stony; while the large extent of black soil in the basin of the Krishna is often stiff and clayey, and requires heavy though not necessarily frequent rain to bring out its productive powers.

9. The most dependable rainfall is found in the valley of the Gatparba, and in the neighbourhood of the hills which contain it, thus coinciding with the locality of the better soil. The average rainfall recorded for the last eight years, as furnished me by the Mánlatdár, is 25·73 inches, an average which is much reduced by the scanty fall in the year 1876-77, but which is fully sufficient for all crops usually grown in plain districts.

10. In Appendix B. is given an abstract, made out from the village officers' returns, and checked so far as possible by the classing establishments, which shows from a four-year average, the proportion of each crop produced in the Government lands of the Táluka. The following summary gives at a glance the information thus gained.

			Kharif.	Rabi.
Cereals (Jowári, Bájri, Wheat, Rice)	...	...	38·34	27·0
Pulses (Tur, Mug, Kulthi, Gram)	...	...	5·46	1·0
Oil seeds (Kardi, &c.)	...	...	...	0·8
Fibre (country cotton)	...	...	...	11·62
Miscellaneous	...	...	1·9	0·93
			45·70	41·35
			87·05	
Waste and Fallow	...	...	...	12·95
			Total ...100·0	

Early and late sown crops are about equally produced, jowári covering by far the largest area in both harvests. Wheat is comparatively little grown, but cotton, the common indigenous variety, is the most important crop sown in the deep black soils, and covers an area of over 16,000 acres. Waste or fallow appear in about the proportion that experience would lead us to expect. On the whole these figures indicate a district in which cotton and a little wheat are the only products grown for export, and where a comparatively large proportion of non-agricultural labour demands a large production of the coarser food grains.

11. There is nothing special to note regarding the method of agriculture in this district. The light red soils which predominate in the central part of the Táluka require annual ploughing, (not a formidable operation in their case, for the plough usually needs but one yoke of oxen), but the black soils are never ploughed except when foul with weeds, lighter implements sufficing, if used with diligence. Manure is applied more generally to the light red soils than to the black, and in the almost total absence of irrigated lands falls more to the share of the dry crops here than is often the case in the plains. Captain (afterwards Sir George) Wingate, in the original settlement report, speaks unfavourably of the agriculture of Bágalkot, and attributes its slovenliness to the employment of the cattle in too large a measure on the carrying trade, and also to deficiency in the number of cattle. Agricultural cattle are shown by the Revision Survey Census to have slightly decreased, but they still average one pair to 27·8 acres of cultivated land, which cannot be considered deficient. The general state of the fields in Bágalkot compares unfavourably certainly with Hungund, but I have not observed that there is any difference on this point between the Tálukas of Bágalkot and Bádámi: my experience, however, dates since the Famine.

12. In the matter of made roads, the Bágalkot Táluka is moderately well provided. Of two provincial roads, the one which connects Kaládgi with Bágalkot passes through the southern portion of the Taluka, and is, with few exceptions, bridged and culverted throughout. The road from Hubli to Sholápur cuts through the centre of the district from south to north, crossing the Gatparba and the Krishna by ford in the fair weather, and ferry in the rains; but with no bridges or culverts: this road is hardly passable in heavy weather.

A Local Fund road from Bágalkot goes south-east to the considerable village of Sirúr, and thence on to Hungund, which town is thus accessible throughout the year ; but neither of the two remaining roads are passable in heavy rain. These two latter connect Kaládgi with the Sholápur-Hubli road, and run north-east and south-east respectively, the former, which is the longer of the two, being 12 miles in length.

13. In Appendix C. will be found information derived from the Mámlatdár regarding the market towns of the Táluka. Of these, Bágalkot is shown to have weekly sales amounting to upwards of Rs. 50,000, and Kaládgi to about half that amount, the only other market mentioned being a small one at Bilgi, in the north-east of the district. Cotton may be said to be the only raw produce exported, and this goes indifferently to Vengurla, Kumta, and Sholápur. Several kinds of cotton manufactures are produced, though to a very limited extent, in Bágalkot—viz, dhoties, priced from Rs. 20 to Rs. 1-4-0 per pair, and Sárís, Págotís &c., ranging downwards from Rs. 20 or 25 in value : these are exported, it is stated, as far as Sholápur, Poona, and even Benares ; but the manufacture of cotton, said even in 1851 to be on the decline, has much decreased since then, and the whole Táluka according to the Revision Survey Census now contains but 395 looms, though the number of looms in Bágalkot itself is stated in the original settlement report at five or six hundred. Bágalkot, however, depends on trade for its importance, and has for long been the largest depôt between Hubli and Sholápur, with both which towns its dealings are considerable. The Railway will no doubt much enhance the position which it thus holds.

14. The figures given and commented on below are the result of the Survey Census\* taken during classification in the fair weather of 1881. They embrace 124 villages out of the 126 under report: the two omitted were settled some years subsequently, and no figures, can be given in their case for comparison, as one is uninhabited, and for the other no old record is forthcoming :—

	At Former Settlement.	1881.	Increase.	Decrease.	Percentage.
Population ... ..	61,540	67,264	5,724	...	9·3
Houses { Flat-roofed and tiled .	12,898	17,729	4831	...	37·5
{ Thatched ... ..	1,395	654	...	741	53·1
Agricultural Cattle ... ..	15,352	14,906	...	446	2·9
Cows, Buffaloes and Young ...	37,397	22,055	...	15,342	41·0
Sheep and Goats ... ..	30,643	25,720	...	4,923	16·1
Carts ... ..	140	1,072	932	...	665·7
Horses and Ponies ... ..	884	630	...	254	28·7
Wells and Budkís ... ..	253	324	71	...	28·1
Tanks ... ..	35	38	3	...	8·6

Population shows a total increase of 5724, or 9·3 per cent., this being the first Táluka revised since the Famine in which any increase has been found by the Survey Census. The increase is distributed over all castes but the Lingaits, (among whom, however, the decrease is but 3 per cent.) and appears to be almost uniformly spread over all villages large and small. This result, I may point out, is consistent with what was observed in the Revision Survey Census of Hungund and Gokák. In those Tálukas the large towns are essentially manufacturing, and the decrease in population was traceable to them and within them in great measure to the Lingait weaving population, as well as to the low caste labourers. In Hungund, whose Census is dated the same year as Bágalkot, it has been shown that while the Lingaits had not recovered their former numbers, the low castes had already done so, so far as to show an increase of 10 per cent.; and that, excluding Lingaits, the total population of the Táluka showed an eight per cent. increase. Bágalkot, the only large town in the Táluka now under consideration, is a trading rather than a manufacturing centre, and traders suffered comparatively little from the Famine. We find accordingly that

the increase is more marked and amounts, in 124 villages, even if Lingaits are included, to 9 per cent. on the total population. The low caste Hindūs in the town of Bāgalkot appear to have recovered in about the same measure as in Hungund, and are now by 11 per cent. more numerous than in 1850-51. If we turn to the Census of 1872 for an intermediate view of the progress of population in the town of Bāgalkot we find that while it had in 1851, 12,013 souls, in 1872 the Census records give 14,002, and the last Census of 1881 states \*12,850 to be the total population: there is evidence, therefore, of a rapid increase of population which has been checked by the Famine.

15. The area under report is 503 square miles, which gives an average of 134 head of population to the mile—a density which must be considered high, for a tract so devoid of irrigation, and is accounted for by the exceptionally large town therein included.

16. In Appendix E. is shown the usual division of the population under

Agricul- tural.	Partly agricultu- ral.	Non-agri- cultural.
45·14	16·03	38·83

the heads of agricultural and non-agricultural. The high proportion of non-agricultural persons is due no doubt to the town of Bāgalkot; but the division thus made can, from the nature of it, be only approximate.

17. The increase in the better description and decrease in the number of inferior dwellings is a feature which can only indicate great progress towards prosperity and the advance in the standard of comfort, which always accompanies such progress. Flat-roofed and tiled houses, it will be seen from para. 14 above, have increased since the original settlement by 37·5 per cent., while thatched dwellings are fewer by 53 per cent.

18. Agricultural cattle, it appears, are fewer in number now than in 1851 by nearly 3 per cent. With regard to this it may be observed that as the present number affords a proportion of one pair to 27·8 acres of cultivated land, it cannot be considered insufficient, especially when the light nature of much of the soil under cultivation is considered; moreover, the late special Census may be taken to have shown that the survey returns usually record the minimum figures. Milch cattle and sheep and goats show the decrease usually observable at revision settlements: this is due in all probability in various degrees to the absorption of grazing land, loss by famine and to the roving nature of this kind of stock, which makes its enumeration difficult and uncertain.

19. Carts are nearly seven times as numerous as at the original settlement, a fact which infers nothing less than a revolution in the conditions of trade and communications since that period, and it seems unnecessary to point out that the chief gainer by the change must be the cultivator of the soil. Horses and ponies are fewer now than in old days, being less in demand as a means of transport.

20. Wells and budkīs show an increase of 28 per cent., but the total number is insignificant, and the deficiency of the old records prevents our ascertaining the purpose to which the new wells have been applied. From the increase in the garden area it may be inferred that many of them are used for irrigation.

21. Tanks are more numerous by 3 than at the time of settlement, which is not a fact affording any inference of importance in a district where tanks are seldom used for irrigation, and number in all but 38. It may be mentioned here, however, that the Irrigation Department have recently completed a fine tank at Muchkhandi, immediately south of the town of Bāgalkot, under which an area of 5,200 acres is commanded. This cannot fail to prove a very valuable addition to the resources of the district, more especially in years of scanty rainfall.

22. There is an increase, though not so large a one as is often found at Revision Settlements, in the proportion of the total population able to read, and in the low castes the proportion is shown to have doubled; the total proportion, however, as given in the return (Appendix D., column 11) is smaller than might have been expected. The number under instruction on the other hand appears unusually large. From

\*By Survey Census in 1881, 12,626.

information furnished by the Educational Inspector, Southern Division (Appendix H.) it will be seen that the average attendance at the 17 Government boys' schools is 983, and at the two girls' schools 47. At 26 \*private schools there is an average attendance of 355 boys, making in all 1,385 or 2 per cent. of the total population under instruction. In Hungund the proportion so taken was 1.5 only.

23. Information regarding subtenures will be found in Appendix I. The proportion of fields cultivated by their occupants is comparatively small, being 58 per cent., while the proportion sublet for money and grain rents is 30 per cent. In the Hungund Taluka these proportions were found to be 66 per cent. and 20 per cent. respectively, and it is worthy of remark that whereas the total Inám fields in Bágalkot are equal to 36 per cent. of the whole, in Hungund the proportion of Inám is but 30 per cent. It is, of course, the case that Inám holdings are more frequently sublet than Government land.

24. Appendices K., L. and M. present in a concise form the records of the Sub-Registrar of the district, for the 5 years from 1878 to 1882, so far as regards transactions concerning land alone. A perusal of any of these statements can hardly fail to impress one with the high value land bears in this Taluka, but the cases of lease perhaps are easiest to form a judgement from, as dealing usually with short periods of time, and being more definite in their conditions. It has often been stated in settlement reports that no useful result is to be obtained by attempting to reduce information of this nature to the form of totalled tables and general averages, but the main ground on which this statement rests is not always perhaps understood. The period for which land is mortgaged or sublet, together with other minor conditions are, of course, factors of great importance in determining the significance of the transaction; but even if all of these conditions could be accurately ascertained, it would be impracticable to reduce each case to a form in which it could fairly be amalgamated with the rest for the deduction of a general average, and this objection would apply, though with less force, to sales, which might be supposed easier to deal with from the absence of the element of time. The main objection, however, is one of principle, not of practicability; for the preparation of any figured statement which aims at comparing the sale or letting value of land with the Government assessment would pre-suppose that the Government assessment and the sale value rest on identical considerations, which is far from being the case. The Government assessment depends on the quality, depth and moisture of the soil in its natural state, and its position with regard to climate and markets. Everything which labor and capital can do, or have done, in the improvement of the land is purposely excluded from the calculation. It is easy to see, therefore, that the effect of the application or misapplication in various degrees, of labor and capital, may be to alter entirely the relative natural values of different fields. Thus we may imagine a deep black soil field of fine quality, and one of red soil of medium depth, lying side by side: the first has been under slovenly, unthrifty cultivation for years, and is matted in places with grass and weeds, the other is clean and enriched by manure, its uneven places banked up, its boundaries hedged and planted with trees, while a good well supplies water to various kinds of garden produce. The Government assessment on the first would double that of the second, but the value in a purchaser's estimation would be very different. Cases like this are not rare, but the mere difference in a farmer's eye between a field temporarily exhausted by unthrifty cultivation, and one that is clean and fit for immediate cropping, is quite sufficient to prevent any general and consistent relation between the Government assessment and the sale and letting value of individual fields. These considerations will, I think, suffice to show that we must be content with the information to be drawn in a general way from a perusal of individual cases of sales, lease and mortgage, while it will also serve to explain why the letting value does not always vary as the assessment.

25. The prices of various produce in the market of Bágalkot for each year since the original settlement have been obtained from the Mámldatár, and are given in appendix N. The

Prices—Appendix N.

\*The information regarding private schools was collected by the Classing establishments.

average prices of jowári and wheat, to take the ordinary food grain of the district and the only grain that may be said to be grown for exportation, are as follows:—

	Jowári.	Wheat.
10 years' average, 1851-52 to 1860-61 ...	47	32
10 years' average, 1861-62 to 1870-71 ...	23	12
11 years' average, 1871-72 to 1881-82 ...	21½	11

I have taken these averages from the years in their natural order, but if we eliminate from the second period the two years most affected by the influence of the American War (1864-65 and 1865-66), and from the third period the two years most affected by the Famine (1876-77 and 1877-78), we get the following sufficiently significant figures:—

	Jowári.	Wheat.
2nd period ...	26	14
3rd do. ...	24	12

We are now passing through a phase of exceedingly low prices, and as these have been included in the averages first shown, it is not absolutely necessary in my opinion to adopt any modification like that given last above, in order to arrive at a fair basis for estimate; I would point to the fact, however, shown by these figures even after eliminating all exceptionally high priced years, that half the amount of jowári, or a still smaller proportion of wheat required during the first decade, would suffice in the last decade of the expiring settlement to

pay the Government demand. With regard to the cotton which is extensively \*grown for export, the cultivator's profit, as shown in my late report on the Hungund Táluka, has during the same period still more largely increased.

26. In Appendix P. (1) is given the Revenue History of the 124 villages which were settled in 1850-51. The revenue which commenced in the first year of the settlement at †Rs. 42,892, progressed steadily but with wonderful rapidity till 1863-64, when it amounted to Rs. 79,585 and all the more remunerative land had presumably

†An average of Re. 0-9-8 per occupied acre.

been ‡occupied. From this point the progress is still steady but more gradual,

‡The 57,452 acres taken up during this period average Re. 0-8-6 per acre in assessment.

and represents the slow absorption of the remaining poor lands whose chief use is for fodder crops and grazing; in this stage the revenue crept gradually upwards till, in 1876, 7,504 more acres had been taken up, averaging 5 annas 7 pies per acre, and the maximum figure of Rs. 82,133 revenue had been reached. Thus, out of the 70,251 acres unoccupied when the settlement was introduced, only 5,295 acres now remained available, and on these the average assessment was 3 annas. I may be permitted perhaps to ask special attention to these figures at a time when the suitability and accuracy of the survey classification of soils has been in some quarters called in question, and to point out that no feature is wanting in this history, which should characterise a moderate and justly distributed revenue demand. The results of the famine are shown in the figures of the last five years, and may be stated shortly as leaving the revenue at about the stage it had reached in 1864 after the first period of rapid increase. The occupied and unoccupied areas, and the proportion

	Occupied.		Unoccupied.	
	Acres.	Rs.	Acres.	Rs.
1863-64 ...	139,733	79,585	12,799	3,735
1881-82 ...	139,032	79,251	13,146	4,122

of assessment on each, coincide indeed so closely in the record of the two years as to show that the individual fields occupied must have been very nearly identical in each, and we may congratulate ourselves on the inference deducible, viz. that the famine has merely thrown out of occupancy the poor and less productive lands lying near the margin of profitable cultivation. Remissions and outstanding balances became of paltry amount, or disappeared altogether immediately on the introduction of the settlement, and though they have to some extent reappeared, in this Táluka as elsewhere, in consequence of the Famine, they are now nearly again wiped out.

27. The following information regarding sales in distraint of Revenue has been obtained from the Mámlatdár of the district :—

Years.			No. of Villages.	No. of Notices.	No. of cases in which it was necessary to resort to distraint.
1879-80	...	...	84	924	181
1880-81	...	...	58	419	199
1881-82	...	...	46	183	9

The number of notices and sales in the first two years shown is considerably in excess of what was found in the adjoining Táluka of Hungund, though in the last year it compares favorably with that Táluka, and is exceedingly low. It is noticeable that with a greater amount of pressure in collection, the area thrown out of occupation is much less in Bágalkot than in Hungund—a fact which may perhaps be due to the special circumstances of the latter as a border district.

28. To sum up, I think the statistics above commented on, taken together with the Revenue history of the expiring settlement, present the picture of a district making a steady and rapid advance in prosperity till the famine of 1876 put a heavy check on its progress: but few signs of the Famine now remain, and with the opening of the Railway which is now approaching completion, we may confidently look forward to a period of prosperity unparalleled in the past.

29. It remains now to set forth the proposed rates of assessment, and in framing these it has not been necessary to vary much from the original grouping, which was arranged in consideration of climate and proximity to the Bágalkot market. Captain Wingate divided the Táluka into 4 groups at rates which graduated in intervals of 2 annas from Re. 1-4-0 to 14 annas. The grouping and rates now proposed are given below.

- 1st. The town of Bágalkot which is equal in climate to any part of the Táluka, and will be confirmed, as a Railway Station, in its command of the traffic of these parts: for this I propose a special maximum dry-crop rate of Re. 1-10-0.
- 2nd. Four villages immediately around Bágalkot and sharing all its advantages, but in a smaller degree: for these a maximum dry-crop rate of Re. 1-6-0 is proposed.
- 3rd. Forty-nine villages lying along the Gatparba valley, and enjoying the best climate in the district, together with easy access to the Railway Station of Bágalkot and the use of the made road from Kaládgi to that town. These villages, for which a maximum rate of Re. 1-4-0 is now proposed, nearly coincide with Captain Wingate's Re. 1-2-0 group, but it has been necessary to introduce a few villages formerly rated at Re. 1, whose position has become especially improved in respect of communications.
- 4th. Forty-nine villages, some of which lie along the border of the last group and share to some extent its advantages of climate, while the remainder occupy the north-eastern portion of the Táluka and are compensated for a somewhat inferior climate by greater facilities of railway communication. This group contains some villages originally rated at Re. 1 and some at 14 annas; the proposed maximum rate is Re. 1-2-0.
- 5th. Twenty-three villages, situated along the banks of Krishna in the north and north-west of the Táluka, which have an uncertain climate and gain less than any others by the approach of the Railway. Fourteen annas is the original maximum rate of these villages; it is proposed now to rate them at Re. 1.

30. There were in all 111 acres of rice land at the time of the original settlement, while there are now 125 acres recorded; of these, 61 acres are Government land, and will bear under the proposed rates an average assessment of Rs. 2-11-0 per acre. By the former settlement there were 310 acres of garden land, of which 100 acres were Government, and paid an average rate of Rs. 2-4-6 per acre; now there are 499 acres in all, the Government portion of which amounts to 241 acres, and will pay an average assessment of Re. 1-7-10 per acre

31. In assessing the garden lands irrigated from wells, the conditions laid down by \*Government have been strictly adhered to. No addition has been made on account of irrigation to the assessment of land under wells sunk since the settlement, and land under wells existing before the settlement has been assessed within the maximum dry-drop rate : but all wells whose water-supply is benefited by percolation from Government tanks have had the usual additional assessment up to double the dry-crop rate imposed on their lands. The total motasthal area has increased from 310 acres to 440 acres, but there is no pathsthal garden land in the Táluka, either according to the former or the revised survey.

32. The estimated results of the proposed rates are summarised in the statement subjoined :—

Class.	No. of Villages.	Maximum Dry Crop rate.	BY FORMER SURVEY.		BY REVISION SURVEY.						Increase of assessment per cent.
			Government occupied land.		Government occupied land.		Government unoccupied land.		Total.		
			Acres.	Assessment.	Acres.	Assessment.	Acres.	Assessment.	Acres.	Assessment.	
		Rs. a. p.									
1st ..	1	1 10 0	2,025	1,813	2,141	2,381	42	13	2,183	2,394	31.3
2nd ..	4	1 6 0	2,500	1,317	2,551	1,759	11	15	2,562	1,774	28.4
3rd ..	49	1 4 0	49,164	30,634	50,187	37,705	8,025	2,008	58,212	39,883	23.3
4th ..	49	1 2 0	65,036	33,834	65,771	45,032	7,823	2,620	73,594	47,702	33.2
5th ..	23	1 0 0	21,883	12,168	22,338	15,114	666	267	23,054	15,381	24.2
	126	...	1,40,640	79,819	1,43,038	1,02,101	14,567	5,013	157,605	1,07,114	27.9

The proposed increase on the Government occupied land is, it will be seen, Rs. 22,282, or 27.9 per cent., while the percentage increase on different groups, varies from 23 to 33 per cent. It appears from Appendix Q. that the increases in individual villages are moderate and in accordance with the increases on their respective groups.

33. There are at present 14,567 acres of Government unoccupied assessed waste land, on which the proposed assessment amounts to Rs. 5,013 or an average of Re. 0-5-6 per acre. Much of this area will no doubt be reoccupied within the next few years.

34. The following table shows the result of the expiring and proposed settlements under every head :—

	BY OLD SURVEY.		BY NEW SURVEY.		Collection of Judi or quit-rent.
	Acres.	Assessment.	Acres.	Assessment.	
Government occupied land ...	140,640	79,819	143,038	1,02,101	...
Government unoccupied arable waste ...	13,507	4,305	14,567	5,013	...
Inám ...	96,591	59,337	95,655	74,280	28,852
Government unassessed unarable waste ...	70,688	...	68,826	...	...
Total ..	321,426	143,461	322,086	1,81,394	28,852

The average assessment on Government occupied land was by the former survey Re. 0-9-1 ; by the proposed rates it will be Re. 0-11-5 per acre, equal to an increase per acre of Re. 0-2-4.

I have the honor to be,

Sir,

Your most obedient Servant,

W. M. FLETCHER,

Superintendent, Revenue Survey, S. M. C.

सत्यमेव जयते

*Revenue Survey and Assessment, Kaládgi, revision of Assessment in 126 villages of the Bágalkot Táluka.*

No. 290.

REVENUE DEPARTMENT.

Bombay Castle, 11th January 1884.

Letter from the Commissioner, S. D., No. 3467, dated 10th December 1883—Submitting for the consideration and orders of Government, correspondence containing proposals for the revision of the existing rates of assessment in 126 villages of the Bágalkot Táluka of the Kaládgi Collectorate.

RESOLUTION.—Of the 126 villages into which it is proposed to introduce a revision settlement 124 constituted the old Bágalkot Táluka, which was first brought under the Survey Settlement in 1850-51. Survey rates are said to have been introduced into one of the remaining villages in 1859-60 and into the other in 1866-67, and the period for which the rates were guaranteed in them was fixed so as to expire simultaneously with that for which the rates were guaranteed in the old Bágalkot Táluka. The circumstances in which these villages were separately settled are not explained.

2. When the original settlement was introduced into the old Bágalkot Táluka, the táluka was in a depressed condition. The previous assessment was too high, and had never been levied in full. There was a want of roads for wheeled traffic, and carts were few and little used for agricultural purposes, even manure being carried by pack-bullocks. Husbandry was not good; in the absence of carts many cattle were employed in carrying, and they were considered by Captain Wingate to be too few for proper cultivation. Little cotton was grown, and little produce of any kind was exported.

3. During the currency of the original settlement there has been much material progress. The road from Hubli to Sholápur, which was being constructed when the settlement was introduced, has been completed, and Bágalkot is now the most important emporium of trade between these two large towns. A good bridged road has been made from Bágalkot to Kaládgi, and there are several Local Fund roads fit for wheeled traffic except in periods of heavy rain. The Eastern Deccan Railway, which passes through the táluka, will shortly be opened. A comparison of the statistics collected at the special census of July 1882 with the figures given in the original settlement papers shows that in the 124 villages which comprised the old Bágalkot Táluka the population has increased by 27·6 per cent., agricultural cattle by 32·5 per cent., sheep and goats by 2 per cent., and that there are now more than 12 times the number of carts which existed at the time of the original settlement. The statistics collected by the Survey Department for the purpose of the revision settlement give much less favourable results, but the Survey and Settlement Commissioner shows, as he has shown before, that there are good reasons for accepting the figures of the special census in preference to those compiled by classers who now remain a short time only in each village. The increases above shown indicate that there was very rapid progress before the famine, and that although there was then undoubtedly much mortality both amongst the population and amongst cattle, the check which was given to the improvement in the condition of the people was but temporary. There was in 1882 one pair of agricultural cattle for every 14 acres of occupied land, and it is thus clear that even if cattle too old or too young for the plough are included in the figures there is now no lack of cultivating power. There has been a large decrease of cows and buffaloes, but there is reason to believe that this is the result not only of the famine but of the contraction of grazing ground. Cotton is now grown on 14 per cent. of the cultivated land. Wheat is at present not grown to a large extent, but Mr. Stewart estimates that 40 per cent. of the arable area of the táluka is capable of producing the more valuable products for export. There can be little doubt that the opening of the railway will give an impetus to the production of such crops.

Captain Wingate showed at the time of the original settlement that there was much need of irrigation, and that there were ample means of providing it. Less improvement has taken place in this respect than there might have been, but the number of substantial and temporary wells (*budkis*) has been increased by 71, and the number of tanks by 3, one of which, situated at Muchkundi, south of Bágalkot, commands 5,200 acres.

4. From the statements appended to Mr. Fletcher's report it appears that from the year of the introduction of the original settlement until 1865-66 there was a continuous increase in the occupied area. The average assessment of the area unoccupied in that year shows that it is of inferior quality. There was on the whole however with slight fluctuations an extension of cultivation until the famine. The largest area is shown as occupied in 1877-78. Since that year there has been a decline. The area unoccupied in 1882-83 was considerable, amounting to 14,073 acres or about 9 per cent. of the total arable area. The average assessment of it is however only about 5 annas per acre, and Mr. Stewart is probably correct in supposing that when prices are oscillating it cannot be cultivated with sufficient profit except perhaps by improving tenants or as an adjunct to other cultivation. When prices remain steadily at a comparatively high standard, as they probably will, when the railway is opened, this land will doubtless be gradually taken up. Except in the year 1876-77 neither remissions nor balances outstanding at the end of the year have been large; in 1882-83 there were none.

5. In the villages to which the proposals relate 58 per cent. only of the fields are cultivated by the registered occupants; 30 per cent. are said to be sublet, and it is presumed that the remaining fields are those lying waste. But Mr. Fletcher has included in the figures lands held in inám, which constitute 36 per cent. of the whole, and the proportion of Government fields which are sublet to the total number of fields appears therefore to be only 22 per cent. Even this proportion however is large, but even if it is undesirable that much of the land should fall into the hands of persons who do not themselves engage in cultivation, the fact that capitalists invest their money in land is an indubitable proof that the assessment does not absorb all or nearly all the true rent. The statements of sales, mortgages and leases appended to Mr. Fletcher's report, which are understood to give the particulars of all the transactions in the villages to which the proposals relate which were registered from 1873 to 1882, show that land bears a high value. In none of the private sales was the price less than 2·6 times the assessment, and in one it was 54·5 times the assessment. The sums paid as rent prove even more conclusively that the assessment represents but a small share of the produce. Mr. Stewart shows fully the causes of the variations in the proportion of the assessment to price, rent and amount advanced on mortgage, and no one who understands the principles on which the assessment is fixed could expect the proportion to be constant.

6. Mr. Fletcher shows the average price of jowári in the first decade of the original settlement period as 47 seers per rupee, that in the second decade, excluding the two years in which the American War caused abnormally high prices, as 26 seers, and that in the third decade, excluding the two famine years, as 24 seers. Mr. McCallum urges that the years of the first decade in which prices were very low should also be excluded, but the low prices of those years were the result of gluts in the market, which are relieved by the improvement of communications. The average price in 1882-83 was 35 seers per rupee. It was higher in the last six months, but Mr. Crawford properly points out that it always rises in the rainy season. The course of the price of wheat was similar, but it is grown only on 1·8 per cent. of the occupied area. Mr. Stewart thinks it would not be safe to assume that the standard price of cereals will be more than 66 per cent. above the average of the first decade of the original settlement period, but for reasons given in the report regarding the revision settlement of the Hungund Táluka he considers that the price of cotton will be higher by 100 per cent. The Commissioner, S. D., doubts whether prices generally will rule higher in the next 30 years than in the period of the settlement which has expired by more than 50 per cent. There is little doubt that the opening

of the railway will create a demand in the district for exportable products and will tend to raise prices generally, but experience has shown that it is not safe to calculate confidently on any standard of prices being maintained even in districts which have the advantage of railway communication. That advantage relieves a district from the exceptional extremes occasioned by isolation, but not from the fluctuations of the wider area with which it is brought into contact.

7. The facts which have been summarized above show that it is reasonable to enhance the assessment, and that a considerable increase might be imposed without taking a larger share of the produce than was taken when the original assessment was first levied. It may be observed however with reference to Mr. Muir's criticism of Mr. Fletcher's report that a Survey Officer is not expected to explain in each report the fundamental principles of the Survey System, and that Mr. Stewart properly shows that Mr. Muir is in error in supposing that one of these principles is to take a fixed share of the produce. The produce is affected to an indefinite extent not only by permanent improvements, but by the method of cultivation in each year. The variations in prices are properly considered to prevent an undue enhancement on a revision of assessment, but the basis of the assessment is the inherent quality of the soil combined with advantages not created by the occupant. It remains to consider the rates proposed and the manner in which they have been arrived at.

8. It is satisfactory to observe that the systems of partial re-measurement and partial re-classification were adopted to the full extent, although 28 villages had to be entirely re-measured owing to their small size and the large proportion of fields in them which had to be broken up or which had been liable to alteration from various causes. It is presumed the area of "pot kharáb" was measured in all cases in which it is recorded in the original settlement papers; if it was brought under assessment in those cases only in which fields were re-measured and not in others, there would be the inequitable distinction referred to by the Commissioner, Southern Division. The Survey and Settlement Commissioner should be requested to state precisely what course was adopted. The scale of classification has been widened as in other revision settlements to relieve the poorer lands and throw on the richer soils a more just proportion of the burden of taxation. The occupants should be informed, as suggested by the Commissioner, S. D., that the classification now made is final.

9. At the original settlement Captain Wingate, finding that the villages in the Ghatprabha Valley had owing to the vicinity of the hills in the centre of the taluka a more favourable climate than the rest, formed four groups according to that advantage and proximity to the market of Bágalkot. The Survey and Settlement Commissioner proposes to adopt that grouping with some modifications which are justified by improvements of communications. It is suggested that the village of Bágalkot, which will contain a railway station, should have a special maximum rate of Rs. 1-10-0; that four villages in the vicinity of Bágalkot should have a maximum rate of Rs. 1-6-0; that the remaining 49 villages in the Ghatprabha Valley should have a maximum rate of Rs. 1-4-0; that 49 other villages, of which some are on the east of the third group and have similar advantages of climate, but are more remote from any railway station, while others have an inferior climate, but are more conveniently situated as regards railway communication, should have a maximum rate of Rs. 1-2-0; and that 23 villages in the north and north-west, which have an uncertain climate and are most remote from the railway, should have a maximum rate of Re. 1-0-0. A maximum rate of Rs. 8-0-0 is proposed for rice land, but only 61 acres of Government land are classed as rice land, and the average assessment of it will be Rs. 2-11-0 per acre. The rules that no addition to the assessment should be made on account of wells sunk by private enterprise during the currency of the original settlement, and that lands under wells existing before the introduction of the Survey Settlement should be assessed within the maximum dry-crop rate have been observed; but a maximum of double the dry-crop rates is proposed for land under wells which benefit by percolation from Government tanks. Only 241 acres however of Government land are classed as garden land, and the average assessment under the proposals referred to will be Rs. 1-7-10 per acre. The result of the proposals is an increase of 27.9 per cent. on the Government land occupied in 1881-82 and of 27.3 on the total Government arable land. The average assess-

ment of the arable area under the original settlement was Re. 0-8-9; that under the proposed revision settlement will be Re. 0-10-11.

10. The principles on which the grouping is based appear to His Excellency the Governor in Council to be sound. The Commissioner, S. D., points out that some of the land in adjoining villages is nearer the town than some land in the Bágalkot village, and that the advantages of different lands within a radius of 5 miles from the town are from an agricultural point of view nearly equal. It is to be observed however that the produce of the surrounding villages has to be carried in the first instance to the village sites and thence to market, and that cultivators living in Bágalkot have facilities for obtaining manure which those living in small villages have not. It is evident that the nearness of their market in a town at which there will be a large railway station is a great advantage and that the rate of Rs. 1-10-0 proposed for the village of Bágalkot is not too high. In the circumstances His Excellency in Council considers the proposals made by the Survey and Settlement Commissioner to be suitable, and is accordingly pleased to sanction them. The rates recommended are in view of the advance made by the taluka during the currency of the original settlement and the rise in the standard of prices which has already taken place and the further rise which may be expected on the opening of the railway exceedingly moderate, but it is expedient that Government should forego part of the demand which might justly be made in order that the people may completely recover from the losses caused by the famine and that their standard of comfort may be materially raised.

11. Mr. Stewart recommends that the revised rates be introduced in the current year, but that a remission of  $1\frac{3}{4}$  annas in every rupee of the revised assessment be granted in each of the years 1884-85, 1885-86 and 1886-87, the full revised rates being levied in and from 1887-88. The recommendation is supported by the Commissioner, S. D., and as a similar proposal has been sanctioned for the Hungund Taluka, it should be sanctioned in the case of this taluka also, which suffered little if at all less severely from the famine than Hungund. The reduced rates should be calculated by the Survey Department and should be promulgated at the same time as the full revised rates.
